TWO WIRE TRANSMITTER WITH ISOLATED CAN OUTPUT

ABSTRACT OF THE DISCLOSURE

transmitter Α variable that process preferably includes a transmitter output circuit that provides bidirectional HART and controller area network communication transceiver lines. The circuit also includes transmitter output sensor isolated circuit circuit interface contacts. An couples to the sensor circuit interface contacts. The isolated circuit includes sensor circuitry sensing a process variable. The isolated circuit further comprises a galvanic isolation barrier galvanically isolating the sensor circuitry from the HART and controller area network transceiver lines. A stacked power supply provides power management. Other aspects may include a controller area network current limiter diagnostic output, timed sequencing of startup microcontroller and shutdown, local a operator interface and power management.
